# SUBJECT INDEX

Aluminium determination in human blood 239–46
Antimony determination in human blood 313
Arsenic determination in human blood 313
Atomic absorption spectrometry 398–403
  continuum-source
  *see also* continuum-source atomic absorption spectrometry
  graphite furnace (GFAAS) 237–334
Atomic emission spectrometry 371–98
Atomic fluorescence spectrometry 403–4
Auto-by-cross correlation 140
Autocorrelation function 31, 42, 60, 73, 74, 81, 90, 113, 114

Beryllium determination in human blood 313
Bismuth determination in human blood 313
Boxcar averager
  background 103–7
  gated RC-type LPF model 107–22
  model 19
  power transfer function
    with baseline subtract 121
    without baseline subtract 112
  time autocorrelation function
    with baseline subtract 123
    without baseline subtract 117
Boxcar integrator 103–26
  background 103–7
  continuous, gated and running 108
  gated RC-type LPF model 107–22
Boxcar models 122–6
  compared with oversimplified model 124
Boxcar reference waveform and impulse response 110

Cadmium determination in human blood 291–301
Chromium determination in human blood 251–4
Cobalt determination in human blood 280
Coherent anti-Stokes Raman spectroscopy (CARS) 146
Continuum-source atomic absorption spectrometry 483–503
  applications 501
  atomic emission measurement 499
  atomization 494–6
  background correction 498
  comparison to other analytical methods 501
  control 496
  current status 494–501
  data acquisition 496
  detection limits 496
  development of method 484–94
  dynamic range 498–9
  line profile measurement 499–500
  optical systems 494
  performance 494–501
  reference materials 500
Copper determination in human blood 246–51

Electro-optical switches 344
Electrothermal atomization technique 170
Electrothermal atomizer interferences 211–14

Gallium determination in human blood 320
Garnet 341
Gas chromatography/Fourier transform infrared (GC/FT-IR) spectrometry 455–82
  analog-to-digital conversion 461–2
  cell volume 457–60
  collection optics vs detector size 463–4
  detector specifications 461
  effect of scan speed 462–3
  light-pipe-based interfaces 457–69
  light-pipe dimensions 460–1
  light-pipe temperature effect 464–5
  optical configuration 463–9
  optical designs 465–9
  trapping eluates 470–8
    with matrix isolation 470–2
    without matrix isolation 472–8
Gated integrator transfer function 107
Gold determination in human blood 262–6
Graphite furnace atomic absorption spectrometry (GFAAS)237–334
Graphite furnace atomizer 167–235
  application of temperature data 211–28
  contoured furnace design 216–18
  dynamic gas temperature distribution 201–4
  dynamic temperature distribution under experimental conditions 180–8
  dynamic temperature environment 229
  effect of heating rate 213–14
  gas temperature 192–201
    and atom loss 193–5
    and atomization 192–3
    measurement 200–1
    models 195–200
  graphite emissivity 177
  graphite properties 174–7
  graphite resistivity 174–6
  heat capacity as function of temperature 177
  matrix modification 212
  models and measurements 192–201
  ordinary graphite 190
  platform-in-tube technique 212–13, 235
  platform temperature measurement 214–15
  pyrolytic graphite 190
  shaped tubes characterization 218–26
  temperature measurement 188–90
  temperature–time characteristics 189, 191

theoretical model evaluation 178–80
thermal conductivity data 177
wall temperature 170–90
wall temperature distribution calculation 173–4

HPLC detectors 446–50
Human blood, trace metals in 237–334

Inverse Raman scattering (SIRS) 146
Iron determination in human blood 254–7

Kerr cells 344
Kerr effect
*see also* Raman-induced Kerr effect

Laser as radiation source 340–8
Laser-excited condensed phase photoacoustic detection 15
Laser micro mass spectrometry 358
Laser micro plasma with cross excitation between two electrodes 360
Laser microanalysis 335–427
accuracy and precision of 365–6
based on atomic absorption spectrometry 398–403
based on atomic emission spectrometry 371–98
fields of application 381–97
ICP-spectrometer methods 397–8
based on atomic fluorescence spectrometry 403–4
based on mass spectrometry 404–14
fields of application 408–14
homogeneity tests of reference materials 366–71
instruments, methodological treatments and analytical features 405–7
main fields of application 339
mode of action 338
mode of action of energy and spike-number measuring accessory 346–8
normal mode pulse 350
of solids 365–71
principles of 337
Q-switched solid state laser 350
sample chamber details 363
scheme of 338
solid state laser parameters 350
technical details of 371
vaporization and excitation under variable pressure and in various gas media 361–5
vaporization of solids 351–5
Laser microemission spectral analysis 364
Laser microscope 346
Laser photoionization spectrometry of molecules in solution 429–53
analytical applications 440–50
assignments 436–8
basic circuits for signal pickup 433
behavior 438–40
bias voltage 438
conductivity signal 434–40
electrode arrangements 439
experimental apparatus 432
highly sensitive detection 441–6
HPLC detectors 446–50
instrumental 432–4
irradiation position 438
laser power 438
leakage currents and nominal purities of solvents 433
temperature effects 440
time profile 434
Laser produced vapour 359–61
Laser radiation absorption at surfaces of solids 351
Laser radiation focusing 348–50
Laser radiation properties 342–4
Laser spot arrangements 368
Laser–target interaction 348–63
Lead determination in human blood 301–12
Light-pipes
*see also* under gas chromatography/Fourier transform infrared (GC/FT-IR) spectrometry
Lithium determination in human blood 320
Local thermodynamic equilibrium (LTE) 355
Lock-in amplifiers 19, 35–103
as multiplier and low pass filter 38
background 35–9
impulse response
in integration limit 49
with RC = 0.2$T$ 52
with RC = $T$ 51
with RC = 5$T$ 50
with RC low pass filter and sinewave reference 80
with second order synchronous LPF and sinewave reference 89
with second order synchronous LPF and squarewave reference 84
motivating example 39–43
power transfer function
in integration limit 58
with RC = 0.2$T$ 63
with RC = $T$ 62
with RC = 5$T$ 61
reference waveform 47
response with third order Bessel LPF and squarewave reference 93
time autocorrelation
in integration limit 68
with RC = 0.2$T$ 71
with RC = $T$ 70
with RC = 5$T$ 69
with other LPFs 91–2
with sinewave reference
and RC-type LPF 79–82
and second order synchronous LPF 88–91
with squarewave reference
and RC-type LPF 43–79
and second order synchronous LPF 82–8
and synchronous low pass output filters to order-3 97

Lock-in integrator time autocorrelation function 95
Low pass filters 35
linear, time invariant, asymptotically stable 17–35

Manganese determination in human blood 286–91
Mass spectrometry 404–14
Measurement problem 12
Measurement scheme 13
Micro plasma generation 348–63, 355–9
Modulation effect on source noise 100
Molybdenum determination in human blood 320

Negative feedback 33
Neodymium-doped glass 341
Nickel determination in human blood 257–62
Noise bandwidth 22, 25, 36, 82, 91, 92
Noise power spectral density 94
Normal Kerr effect (NKE) 151

Optimum reciprocal time constant 135, 138

Palladium determination in human blood 266–71
Phase sensitive detection 35
Photoacoustic detection system 14, 139
Photoacoustic signal generation 16
Photoacoustic signal waveform 17
Photoacoustic time and frequency domain signals 18
Photoionization spectrometry
*see also* laser photoionization spectrometry
Platinum determination in human blood 266–71
Pockels cells 344
Power *S/N*
vs number of paired measurements performed 136
vs number of single measurements performed 134
Power transfer function 22, 24, 56, 57, 60, 82, 107

Q-switched lasers 354
Q-switching technique 341, 344–6
with saturable absorbers 345–6
Quality factor (*Q*) 96

Radiation detectors 376–81
Raman effect 145
Raman-induced Kerr effect 145–66
background suppression 162
cancellation results 164
definition 147
double-beam 162
effect of square of number density of scattering molecules 159
effect of square of pump field power 158
experimental investigation 152–4
experimental observations 155
first experimental verification 147
intensity-detected 161
polarization conditions necessary for 147
polarization scheme 148, 152
probe field power 157
results and discussion 154–63
signal processing 154
signal-to-noise ratio limits 159–62
spectra obtained 147
theoretical aspects 149–51
Raman scattering 146
Raman spectroscopy 145
RC low pass filter (RC LPF) 21–32
cascaded, independent, equal time constant 34–5
RC LPF, with true integration as limiting case 32–4
Ringsdorf graphite tubes 179–80
Rotating reflectors 344
Ruby lasers 341, 345

Selenium determination in human blood 271–80
Shot noise limit 101
Signal averagers 106
Signal-to-noise ratio limits 159–62
Signal-to-noise-improvement ratio 92
Silicon determination in human blood 320
Sinewave pulse reference lock-in models 92
Solid state resonators 341–2
Spark discharges 359–61
Spectral apparatus 376–81
Spectroscopy by inverse Raman scattering (SIRS) 146
Strontium determination in human blood 320
Synchronous low pass filter 33

TABLASER 403–4
Tellurium determination in human blood 320
Thallium determination in human blood 321
Time autocorrelation function 24
Time variant filters 7–143
background 17–21
Time variant functions 102
Tin determination in human blood 321
Trace metals in human blood 237–334

Unipolar finite-duration squarewave signal 126–37

Vanadium determination in human blood 280–2

White noise, single and paired measurements 130–3

YAG 341

Zinc determination in human blood 282–6
